Project Design Phase
Proposed Solution Template

Date	[DD Month YYYY]
Team ID	[Team ID]
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Network service requests (new or existing connections) are typically raised informally by phone or email. Details are incomplete or re-entered, approvals are chased manually, and requesters have no visibility of status. There is no single structured record linking the request, its approval and its fulfilment.
2.	Idea / Solution description	A ServiceNow solution that: • provides a Network Request catalog item (Service Catalog, category Network) with seven variables and a Requester Information variable set; • uses the Catalog UI Policy 'Show existing ID field' to show the existing-ID field only for Existing connections; • runs the Flow Designer flow 'Network Request Automation', which creates a Database Tables (u_database_table) record, generates an acknowledgement email record, asks for approval and updates Approval Status; • provides the 'Approval Request' relationship to show related approvals; the Network Team closes the catalog task.
3.	Novelty / Uniqueness	Combines dynamic catalog fields, pre-filled requester details, an automated record, approval and notification sequence, and a filtered approvals related list, all with low-code ServiceNow features (Flow Designer, UI Policy, relationship script) and no custom application code beyond the short relationship query.
4.	Social Impact / Customer Satisfaction	Requesters get one simple form and a clear process; the Network Team receives complete, structured requests with an approval trail. Once SMTP is configured, requesters will also receive an acknowledgement email; delivery is not yet verified.

5.	Business Model (Revenue Model)	Internal IT service, not a revenue-generating product. Value comes from operational efficiency: less manual data entry, faster approvals, and fewer lost or incomplete requests. It could later be packaged as a reusable scoped application.
6.	Scalability of the Solution	Runs on the ServiceNow cloud platform. More catalog items, approvers, approval rules and branches can be added by configuration. Before production rollout: move to a scoped application, configure SMTP, assign approval groups, and review access controls and the trigger design.
